1. The amendment filed on 9/24/04 has fully considered. The amendment of independent Claim 49 is fully responsive to the discussion held in an interview dated: 09/20/04, to result the difference, "upper bits which indicate a position of a processing packet in a memory", from prior art of record, Christie et al., US Patent No. 5,559,975.

Reasons for Allowance

2. Claims 2-11, 49 are allowed.

Prior art of record, Christie, discloses a processor that reads ROP instructions (four-bytes processing packet). Using a less significant program counter (counting bits are generated via a decoder) and a more significant program counter, the processor reads every byte of a ROP and reads all the ROPs through out the memory.

As pointed out by Applicants (Remarks, page 7) that Christie's lower bits (less significant program counter) are generated by a decoder, instructions stored in the memory are not indicated by the combination of the upper and lower bits.

Therefore, the following is an examiner's statement of reasons for allowance:

The cited prior arts taken alone or in combination fail to teach the claim to a processor for reading instructions comprising at least features:

"at least one processing packet having a natural number of bytes, the processing packet including a predetermined number of processing target instructions, each processing target instruction being an operation to be executed by the processor, the number of processing target instructions being any natural number except for a power of 2;

a first address indicator configured to indicate a storage position of the processing packet in the memory; and

a second address indicator configured to indicate a position of a processing target instruction within the processing packet by using the same number of positions as the predetermined number of

processing target instructions, and cycling through the positions within the processing packet by an increment value" as recited in such manners in independent Claim 49.
